**EXAMINER'S AMENDMENT**

**DETAILED ACTION**

6. The following is an examiner's statement of reasons for allowance: The newly amended Claim 19 recites: "A coupling device comprising a first connector part and a second connector part, each connector part including at least one connecting portion configured to engage with at least one corresponding connecting portion of the other connector part to connect said first and second connector parts in substantially linear alignment with one another, a releasable locking member configured to assist in disengaging the engagement between said connecting portions, said releasable locking member having a first engagement structure and being secured to the first connector part in a fixed position relative to a longitudinal axis of said first connector part while being rotatably movable about said first connector part at said fixed position, said second connector part having a disk with a through-going hole in communication with each corresponding connecting portion, respectively, and a second engagement structure on said disk, said first and second engagement structures being complementary to one another to engage through respective rotational movement thereof about said longitudinal axis to lock the connection between said first and second connector parts against separation in response to longitudinally directed force in an absence of respective counter-rotational movement of said first and second engagement structures." And Claim 30 recites: "A coupling device comprising a first connector part and a second connector part, said first connector part including two male luer lock connecting portions configured to engage with two female luer lock connecting

portions of the second connector part to connect said first and second connector parts in substantially linear alignment with one another through axial movement, a releasable locking member configured to assist in disengaging the engagement between said connecting portions, said releasable locking member having a first engagement structure and being secured to the first connector part in a fixed axial position thereon while being rotatably movable about said first connector part, said second connector part having a transversely extending disk with a second engagement structure thereon, said first and second engagement structures being complementary to one another to engage through respective-rotational movement thereof to lock the connection between said first and second connector parts against separation in response to axial force."

The device that most closely resembles applicant's claimed invention is found in the art Brown et al. (US Patent 4701159). Brown recites a two piece connector that joins at more than one connecting point and has gaps in a disk. Brown even has a first engagement structure that rotates around the first connector, but does not do so at a fixed position. Shoor (US Patent 4256106) recites such a connection allowing resistance to axial motion, while still allowing rotational motion, however, this connection is not permanent and describes the connection between the two connectors, there is no engagement structure. Since the combination of these devices would render them unusable, applicant's invention successfully obviates the prior art and is allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
